

Amendments to the Specification:

Please replace the paragraph beginning at page 13, line 20, spanning to page 14, line 3 with the following amended paragraph:

As seen from the following Table 1 and Fig. 10, a condition in which more than 95% of the video signal VD can be charged for this pixel (PIX(768,3072)) within a charge time of about 10 μ s is satisfied where the organic protective film 48 has a thickness (d) of 0.8 μ m or less and a dielectric constant (ϵ) of less than [[2]] 3.0 and a case where the organic protective film 48 has a thickness (d) of 1.3 μ m or 1.5 μ m and a dielectric constant (ϵ) of less than 4.0.

Please replace the paragraph beginning at page 14, line 7 with the following amended paragraph:

Also, the video signal VD can be sufficiently charged rapidly in a charge time (i.e., 9.3 μ s) when a thickness (d) of the organic protective film 48 is 0.9 μ m and a dielectric constant (ϵ) thereof is 3 in accordance with a timing margin between gate pulses. A thickness of the organic protective film 48 is limited to at most 1.5 μ m in consideration of the coating uniformity and the etching uniformity in the organic protective film 48 as mentioned above.

Please replace the paragraph beginning at page 15, line 5 with the following amended paragraph:

In the table 2, parasitic capacitance values are values measured when a thickness of the organic protective film 48 coated on the data line [[54]] 52 is 1.25 μ m and an area (A) of the overlapping line 56a at which the pixel electrode 50 is overlapped with the data line 52 is 837 μ m². The area (A) is a case where a length in the longitudinal side of the pixel cell

(PIX(768,3072)) is 279 μ m and a width of the overlapping line 56a at which the pixel electrode 50 is overlapped with the data line 52 is 3 μ m. On the other hand, the parasitic capacitance of the overlapping line 56b where the pixel electrode 50 is overlapped with the gate line 54 is [[less]] greater than the parasitic capacitance of the overlapping line 56a because a thickness of the organic protective film 48 is ~~thicker~~ thinner than that between the pixel electrode 50 and the data line 52.
